Overview

The growing number of publicly available information sources makes it impossible for individuals to keep track of all the various opinions on one topic. The goal of our *fuzzy believer* project is to extract and analyze statements of opinion from newspaper articles.

Beliefs are modeled using a fuzzy-theoretic approach applied after NLP-based information extraction. A fuzzy believer models a human agent, deciding what statements to believe or reject based on different, configurable strategies.

Resources

Our [reported speech tagging components](#) are now available as free/open source software.
